

Document	Project Charter
Project	Luxury Retail Employee Flash Sale Operations System
Developer	Nandani Raj
Target Role	Operational Excellence Power Apps Developer
Tools	Power Apps · Power Automate · SharePoint · Power BI · SQL
Date	June 2026
Version	1.0

1. Project Objective

Build a fully functional, low-code operational support system using Microsoft Power Apps, Power Automate, and SharePoint Online that manages the complete employee flash sale lifecycle — from pre-sale configuration and controlled access management through live-sale issue resolution to post-sale cleanup, compliance logging, and operational reporting.

The system is designed to be realistic enough to demonstrate production-level thinking, documented thoroughly enough to serve as a portfolio-ready implementation reference, and structured clearly enough to walk through in a technical discussion.

2. Business Problem

Luxury retail companies offer employee-exclusive flash sales as a key staff benefit: deeply discounted products available for a short, tightly controlled window. These events require coordinating HR eligibility verification, IT access provisioning, operations readiness, and post-sale access revocation — all under time pressure and within strict brand governance standards.

Without a purpose-built system, this process relies on email chains, spreadsheets, and manual approval threads. The result is a predictable set of operational failures:

- Unauthorized employees gain access due to missed approval steps
- Approval requests go unanswered because there is no centralised queue
- Sale readiness cannot be confirmed — launches are delayed or cancelled
- Active-sale issues have no structured intake channel
- Access is not revoked after the sale ends, creating compliance exposure
- There is no audit trail to reconstruct who had access, when, and why

3. Why This Matters in Luxury Retail

Flash sale operations in luxury retail carry greater operational weight than in general retail. Several factors make this context distinct:

Brand Protection

In luxury retail, exclusivity is a core product attribute. An unauthorised purchase — even by an employee — can create brand exposure or policy violations that are difficult to reverse. Access control is not just an operational preference; it is a brand requirement.

Access Precision

Unlike general retail where broad access is acceptable, luxury operations require granular, role-based access with documented justification and approval. The system must enforce eligibility rules and maintain a verifiable record of every access decision.

Compliance and Audit Requirements

Employee benefit programmes are subject to HR, tax, and financial audit obligations. A system with no audit trail creates significant compliance risk. Every approval, denial, and revocation must be logged with a timestamp and an identified responsible party.

Operational Time Pressure

Flash sales are short windows. A missed approval workflow or an incomplete launch checklist can result in a cancelled event — a direct business and employee experience failure. The system must support rapid, confident decision-making under time pressure.

Post-Event Accountability

Unlike a standard promotion, an employee flash sale must close completely — access revoked, cleanup confirmed, records retained for a defined period. A system that handles setup well but not closure is operationally incomplete.

4. Target Users

Role	Description	Primary App Actions
Operations Admin	Runs the flash sale process end-to-end	Create sales, manage access, run checklist, authorize launch, review issues, oversee cleanup
Manager / Approver	Approves or denies employee access requests	Receive approval emails, review and respond via Power Automate approval interface
Employee	Requests access to participate in a sale	Submit access request, check request status, log issues during the sale
Read-Only Viewer	Monitors sale operations without editing	View sale status, access request summary, and issue log — no write access

5. Scope

In Scope

- Sale event setup and configuration management
- Employee access request and structured approval workflow
- Access management screens — grant, revoke, bulk audit view
- Pre-sale readiness checklist and gated launch authorisation
- Live-sale issue tracker with priority classification and resolution tracking
- Power Automate flows: approvals, notifications, reminders, cleanup triggers

- Post-sale cleanup tracking and audit log
- SQL validation scripts for data integrity and operational reporting
- Refreshable Power BI operational dashboard
- Portfolio-ready documentation and implementation summary

Out of Scope

- Integration with live POS or e-commerce systems — data is simulated via SharePoint
- Active Directory provisioning or employee identity management
- Financial or payroll system integration
- External-facing customer portals or vendor systems
- Native mobile application development — the app is web-responsive only
- Multi-tenant or cross-organisation configurations

6. Tools and Technologies

Layer	Tool	Role in the System
Presentation	Microsoft Power Apps (Canvas App)	All user interaction — role-based screens, forms, validation
Process Automation	Microsoft Power Automate	Approval routing, notifications, reminders, cleanup triggers
Data Backend	Microsoft SharePoint Online	8 structured lists — primary data store for all system records
Reporting	Microsoft Power BI	Refreshable operational dashboard — 4 pages, DAX measures
Validation	SQL Server / T-SQL	9 validation scripts for data quality and SLA monitoring
Documentation	Markdown, Word, PDF	GitHub repository, portfolio documentation, build reference

7. Business Value

The system delivers value across four operational dimensions:

Process Reliability

Every stage of the flash sale lifecycle has a defined, automated path. Approval requests are routed automatically, launch is gated behind a completed readiness checklist, and post-sale cleanup is triggered by a status change — not a manual reminder.

Access Control and Compliance

Every access decision — approval, denial, or revocation — is logged with a timestamp, an identified approver, and a reason. The audit trail is complete from request to revocation.

Operational Visibility

Operations managers have a single interface showing all active sales, pending requests, open issues, and readiness status. The Power BI dashboard provides post-sale KPIs for retrospective analysis and planning.

Scalability

The system supports multiple concurrent sales, multiple locations, and role-based access across an unlimited number of users — all without code changes. Adding a new sale is a data entry task, not a development task.

8. Success Criteria

- An employee can submit an access request and receive an approval decision notification without any manual admin intervention
- An operations admin can complete the pre-launch readiness checklist and authorise a sale launch from within the app
- A high-priority issue logged during an active sale triggers an immediate notification to the admin team
- Post-sale access revocation is tracked and confirmed via the app and audit log
- The Power BI dashboard correctly displays readiness score, approval rate, open issue count, and average resolution time
- All 9 SQL validation scripts return correct results against the sample dataset
- The complete system is documented at a level that supports handover to another developer or system owner

9. Implementation Status Summary

Component	Status
Project Charter and System Design	Complete
SharePoint Backend — 8 lists with full schema	Design Complete — Build Pending
Power Apps Canvas App — 10 screens	Design Complete — Build Pending
Power Automate Flows — 7 flows	Design Complete — Build Pending
SQL Validation Scripts — 9 scripts	Design Complete — Build Pending
Power BI Dashboard — 4 pages	Design Complete — Build Pending
Documentation Suite	Complete (design phase)
GitHub Repository and Portfolio Materials	In Progress

Note: Full specification documents for all components are available in docs/System_Build_Plan.pdf and docs/SharePoint_Backend_Schema.pdf. All sample data referenced in this project is synthetic and created for demonstration purposes only.
